Kirichenko A.I.

Bachelor Student,
National Aviation University

Today the successful operation of enterprises and producers and consumers coordination relations are possible by increasing the enterprises competitiveness, which in turn is based on the improvement of quality management systems, providing the population with safe and quality products, concern for the environment, improvement of working conditions of personnel on workplace.

Modern organizations, functioning in the market economy, collaborating with many domestic and foreign companies for whom quality is paramount. Currently, most large companies prefer to companies that have built a quality management system and consider it the foundation of its work.

However, the experience of international standards to Ukrainian companies are insignificant and should study the benefits that would bring real benefits to enterprises compared with international experience. Today more urgent among domestic enterprises is a question of building a quality management system and maintaining it in operating condition.

In order to increase the degree of trust and regulation of relations between market participants have been developed and implemented international standards, includ-

ing ISO 9000, ISO 14000, OHSAS 18000, SA 8000 and others. Using these standards will enable domestic enterprises to identify strengths and weaknesses, to conduct a comparative assessment of generalized models provide a basis for continual improvement of the company, to measures regarding competitiveness and external recognition.

As a result, implementation of international standards can obtain significant benefits for businesses, including:

- increase technological development of quality management systems, implementation and operation; creating a single harmonized management structure;
- reduce development costs, operation and certification systems;
- a combination of a number of processes (planning, management review, document management, education, internal audits, etc.) increased mobility and greater adaptation to changing conditions;
- more attractive for consumers, investors and other stakeholders;

International experience shows that only those companies that were able to introduce a quality system can achieve sustainable success in the global market.
